Online-News for Plastics and Pharma Technologies

**[EU Data Protection Regulation: Read the complete data protection agreement here](#)**

inForm.Intro

Dear Readers,

Trainees and students secure the future of tomorrow. Therefore our mission is to promote each talent individually. We support young people to set course for their professional career and offer them a specific training tailored to each personality.

Since our beginnings as a training company, more than 200 specialists have successfully completed their apprenticeship or studies. We attach great importance to the quality of the training and rely on our concept of high-tech infrastructure, supervision by educators and training officers as well as joint activities. As you can see, the topic of education has a long tradition with us and enjoys a high status.

We are very proud of the award "Germany's best training company", which we received in the context of the comparative test of the magazine "Germany Test" and "Focus Money". Find out more about the study in this newsletter issue.

With the warmest wishes for the coming summer months,  
Pamela Braun

**[New ENGEL machine to expand the technology center](#)**

In addition to the restructuring of the technology center, Braunform, as an innovative family-owned company, attaches great importance to investing in machinery in order to expand and technologically adapt it to future market requirements. The injection molding machine "Engel e-motion 940H / 440V / 650 T combi" can be used flexibly with a fully electric machine concept. The high-speed version of the clamping unit enables the fastest possible dry cycle times and cycle times for tools up to > 10,000 kg and 1300 mm installation height. With the self-learning precision form protection software "autoprotect", extremely low tolerances of 0.1 kN and higher can be precisely set. Significant advantages regarding the injection unit are the precision of the boost function 1400 cm<sup>3</sup> / s, highly wear-resistant mass cylinders up to 450 ° C and the programmable start-up circuit. In addition to the all-electric movements hydraulic core trains can be operated. In the Technology Center, pre-series runs can be carried out on a total of 9 of our own injection molding machines with a clamping force of 1,000 - 6,500 kN.
